

## **Title: 96 Tubes**

over my morning coffee its my lab note book i read, not poetry  
results i got already not enough to support my theory  
to understand complex systems make a simple model and plan  
that you can test thoroughly use the data to form a theory  
positive control, negative control will tell you if your assay is wrong  
no expectation and no distraction till the final moment of detection  
to test every condition temperature, time, pH, concentration  
now with 96 tubes all look the same to me  
if I mix any of this my data will not make any sense  
can't reproduce, nothing to use take a deep breath and start over again
